To:

STIC-Biotech/ChemLib

Subject: sequence search 10/800,179

Please search SEQ ID NO:19 in Application 10/800,179.

The claim is drawn to proteins 'comprising' SEQ ID NO:19.

Thank you, Andrew Kosar

Forming inorganic structure, for use as e.g. electronic photonic and nano composite materials, comprises providing substrate with repeat protein polymer, and exposing substrate to precursor containing inorganic

Claim 12; Page 8; 27pp; English.

The present invention relates to a method for forming an inorganic structure. The method comprises providing substrate with a repeat proteir polymer, and exposing the substrate to a precursor comprising inorganic species. The repeat protein polymer catalyzes the formation of an inorganic structure on the substrate. The repeat portion of the repeat protein polymer may be ADK51951-ADK51957, which may have a head sequence at the N-terminal end (ADK51958) and a tail sequence at the C-terminal end (ADK51958). protein

The protein contains 12 repeats of the SELP8K monomer sequence (AAR80339). The protein can be used as a polymer substrate in an isopeptide cross-linking reaction catalysed by a transglutaminase enzymatic activity, e.g. Factor VIII or XIII. The polymers can be used in biological systems where in situ formation of a biocompatible material with structural integrity is required e.g. as medical adhesives and sealants or for wound closure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence of the

This SELPBK polymer sequence (mol.wt. 69,772) has been constructed from monomers composed of repeat units derived from silk fibroin (AAW09206) and elastin (AAW09207) (claim 4). The monomer (AAW09212) has been amplified by multicopy cloning in Escherichia coli (using plasmid pPT0345) to produce a recombinant protein polymer backbone with Lys functional groups for subsequent polyfunctional chemical crosslinking. The crosslinked polymer product forms a strongly adherent tissue adhesive or sealant. The polymer may be used to seal defects in vessel walls, e.g. artery, vein, capillary, lung, dura or colon, to increase tissue mass, or to produce biocompatible films for in vivo use. The sealants have the biocompatiblity of fibrin glues for in vivo use. The sealants have the biocompatible films for in vivo use. The sealants have the biocompatible films for in vivo use. The sealants have the biocompatible films for in vivo use. The sealants have the biocompatible films of the polymer product by recombinant methods, are easy to administer, and are gradually resorbed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Tissue repair adhesive comprising polymer of structural protein repeat units - contg. hetero-atom functional gps. reactive with crosslinking agent, combines biocompatibility and high bonding strength.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 2; Page 25; 103pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                         This is the amino acid sequence of pPT0345 comprising the SELPBK protein, used in the method of invention, which involves the preparation of synthetic DNA sequence having repeating units from about 3-15 codons and encoding a protein of at least about 30 kDa. The method is useful for the production of high molecular weight polymers (e.g. synthetic silk), either nucleic acids or peptides that are the expression products of the nucleic acids and particularly high molecular weight peptides containing repeating units which are useful structural materials
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preparation of synthetic repetitive DNA - useful for construction large protein polymers having repeating units, used in structural material, e.g. synthetic silk.
                                                                                                                                                                                                                                                                                                                                                                     Sequence 884
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 1998-193613/17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ferrari

CC SELPBK polymer is a synthetic silk-like protein comprising multiple CC copies of a monomer (see AAW49726) consisting of repeating units of silk-like sequences (CAGAS) and elastin-like sequences (VPGVG) including a CC reactive lysine residue. It was expressed in Escherichia coli from a CC plasmid ppT0345 as a 80 kDa protein. The SELPBK polymer was specifically CC designed to be functionalised with different reagents reactive to amines. CC claimed recombinant protein polymers are capable of covalent crosslinking by enzymatic reaction to form products which set quickly and have good CC dathed recombinant protein polymers are capable of covalent crosslinking by enzymatic reaction to form products which set quickly and have good CC adhesive properties and high strength. The proteins can comprise a CC repetitive maino acid backbone of repetitive units having collagen, CC fibroin, elastin or keratin motifs and at least 2 enzyme recognition CC sequences comprising a glutamine or lysine capable of enzyme catalysed CC isopeptide formation. The products can be used as medical adhesives and CC sealants, in the closure of wounds and repair of damaged tissue. (Updated CC on 25-MAR-2003 to correct PF field.)

                                                                                                                       This invention describes a novel crosslinked protein composition (A) in which, before crosslinking, the protein (I) is new and comprises at least 70 wt. $ of repeating units GAGAGS (1) and GVGVP (2), and in at least two repeating units an amino acid (aa) is substituted by Lys or Arg to provide a Lys/Arg equivalent weight of 1-20 kD. (I) contains at least two as having a functional group reactive with at least one of aldebyde, iso(thio)cyanate and activated carboxy. (I) have similar biocompatibilty to fibrin glues, but set more quickly and give a bond with greater shear strength. They are made from readily available natural sources, are easy to administer and are gradually resorbed. This sequence represents a crosslinking protein polymer unit designated SELPBK
                                                                                                   Sequence 884 AA;
                                                                                                                                                                                                                                                                                                      Crosslinked protein composition, useful as tissue adhesive or sealant, comprises peptide repeating units that contain functional groups react with crosslinker.
                                                                                                                                                                                                                                                                               Example

The polymers comprise a functional group which can be chemically crosslinked with appropriate crosslinkers. The protein polymer is produced by recombinant DNA technology. The protein polymer is useful for sealing or filling a defect in viable tissue, particularly for augmenting tissue mass. The protein polymer is useful in a variety of applications related to their physical, chemical and biological properties, and/or to bond together separated tissue to provide a stable, flexible or resorbable bond. The protein is particularly useful as a sealant or adhesive, in wound healing or as a burn dressing e.g. to stop or staunch the flow of fluid (e.g. blood) through ruptured vessels (e.g. arteries or veins). The present sequence represents SELP8K polymer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Crosslinked protein composition used as sealant or adhesive for sealing or filling defect in viable tissue, as burn dressing, or in wound healing e.g. to staunch flow of fluid e.g. blood, through ruptured vessels.

                                                                                                                                                                                                                                WPI;
                                                                           Sequence 884
                                                                                             The present invention relates to crosslinked protein composition. The invention is useful as sealants or depots to provide for relatively uniform release of a physiologically active product e.g., drug and for the formation of articles of manufacture such as gels, films, threads, coatings. The present sequence is plasmid pPTO345 SELPBK polymer proteins.
                                                                                                                                                                                    Crosslinked protein composition useful as sealing a defect in tissue, protein prior to crosslinking comprises repetitive units of 3-15 amino acids of natural structural protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABW01628

The repeating unit gagags is found in naturally occuring silk fibroin protein. Silk-like proteins mimic the composition and physical properties of silk of Bombyx mori. The repeating unit group is found in naturally occuring elastin The protein mimics the properties of elastin and provides for elastineries. (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                          Sequence 2257 AA;
                                                                                                                                                                                                                                                                      The SELP3 multimeric protein contains the (GAGAGS)n motif typical of silk -like proteins (see AAR41006 and AAR41007) as well as the (GVGVP)n motif typical of elastin-like proteins (see AAR41009). The synthetic DNA coding sequence for SELP3 was constructed by self-ligation of sticky-ended momommer coding sequences. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                     DNA compsn. encoding peptide contg. oligopeptide repeating unit(s) provides efficient prodn. of e.g. silk-like protein(s) elastin-like proteins and antigens for immunisation.
                                                                                                                                                                                                                                                                                                                                                                       WPI;

The general method allows production of fibrous or structural proteins, including crystalline, elastomeric, tough and bony materials such as those that mimic (and can substitute for) silk, elastin, collagen, keratin etc. The properties of the protein can be controlled by varying the type of units in the monomer, the number of units per multimer, the spacing between them and the number of multimer repeats. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Preparation of synthetic DNA encoding a protein comprising short - by synthesising oligomers, annealing and oligomerising these, particularly to produce proteins that mimic silk, collagen etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SELP3 is a 168 kDa synthetic protein that contains multiple copies oligopeptides (GVGVP and GAGAGS) similar to those found in natural elastin and fibroin, respectively. It is encoded by a synthetic repetitive DNA that was produced using a claimed method in which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 5; Col 45; 90pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 1997-340943/31.
                                                  340

The method is useful for the production of high molecular weight polymers (e.g. synthetic silk), either nucleic acids or peptides that are the expression products of the nucleic acids or protein that are the expression products of the nucleic acids and particularly high molecular weight peptides containing repeating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               units which are useful as structural materials
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example

                    The present invention describes a recombinantly produced protein (I) of 30 to 250 kilodaltons (kDa), where 50% of the protein is comprised of at least 1 repeating unit of a naturally occurring protein. The proteins comprising repeating units may be used as fibrous or structural proteins, including crystalline, elastcomeric, tough and bony materials e.g. proteins sintlar to but different from, silk, elastin, collagen, keratin or other naturally occurring structural polymers having repetitive amino acid sequence motifs. The proteins may have the capability of forming or participating in the formation objects such as films, fibres, gels, membranes or may be amorphous, such as in adhesives, coatings, viscous
                                                                                                                                                                                                                                                                                                                                             Proteins containing repeat units of as fibrous or structural proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Crissman
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Repetitive unit; repeat; prosthe

                                   The invention relates to a recombinantly produced protein of 30-250 kD comprises at least 50% (by number of amino acids (aa)) of a naturally occurring repeat unit, of 3-20 aa, from a naturally occurring structura protein (especially silk fibroin and elastin, also collagen and fibronectin (FCB)). The recombinant proteins are useful, e.g. as structural components of prosthetic devices or synthetic fibres. The physical properties of the protein can be adjusted by varying the combination of repeat units, and the protein may retain the properties natural proteins while also having additional properties. The present sequence is a recombinant protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ferrari F
Cappello
                                                                                                                                                                                                                                                                                                                                                                  New recombinant protein containing naturally occuring useful e.g. for making prosthetic devices, mimics the silk or elastin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bombyx mori.

                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a novel recombinant protein (1) of at least 30 kDa comprising at least 50 percent of amino acids of at least one naturally occurring repeating unit of a naturally occurring structural protein, where a repeating unit comprises 3-20 amino acids, and where each of the same repeating unit comprises the same amino acids. (1) has a variety of uses including use as structural component of e.g. prosthetic devices and synthetic fibers. The protein has the properties of a naturally occurring structural protein but can be modified to have new properties. This sequence represents SELP3, a recombinant structural protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                              Sequence 2257
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New proteins useful as structural components of e.g. prosthetic devices and synthetic fibers, comprise at least one naturally occurring repeatirunit of a naturally occurring structural protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADE44977;

elastin precursor, long splice form - human

N;Alternate names: tropoelastin

C;Species: Homo sapiens (man)

C;Date: 22-Uun-1990 #sequence revision 26-Jul-1996 #text_change 09-Jul-2004

C;Accession: A32707; A33705; A30524; A53891

R;Indik, Z; Yeh, H; Ornstein-Goldstein, N; Sheppard, P; Anderson, N; Rosent

"Determination of the site of disulfide linkage between heavy and light chains of silk fibroin produced by Bombyx mori.";

Biochim. Biophys. Acta 1432:92-103(1999).

-i- FUNCTION: Forms the silk filament; a strong, inextensible, insoluble and chemically inert fibre.

-i- SUBUNIT: Formed of two chains: heavy and light, that are linked by a disulfide bond. Heavy-light chain assembly is essential for the efficient intracellular transport and secretion of fibroin.

-i- TISSUE SPECIFICITY: Produced exclusively in the posterior (PSG)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DISULFID

DOMAIN: Composed of antiparallel beta sheets. The strands of the beta sheets run parallel to the fiber axis. Long stretches of silk fibroin are composed of microcrystalline arrays of (-Gly-Ser-Gly-Ala-Gly-Ala-)n interrupted by regions containing bulkier residues.
